

ABSTRACT

A sanding device for a sanding machine includes a carrier, a sanding element and at least two coupling elements with which the sanding element is coupled to the carrier. A
5 movable connection is provided between the sanding element and the carrier, and the ends of the coupling elements coupled to the sanding element may move relative to each other during sanding. Furthermore, a sanding device for a sanding machine includes a carrier, a sanding element and at least one
10 coupling element with which the sanding element is coupled to the carrier. The coupling element is connected to a base, and the base is connected releasably and rotatably to the carrier.
